1 Application

This specification applies to the color 40.0" TFT-LCD Open Cell LK400D3HA14
（With parts in surrounding(C-PWB,FPC) to drive it.）

* These specification are proprietary products of SHARP CORPORATION ("SHARP") and include materials protected under copyright of SHARP. Do not reproduce or cause any third party to reproduce them in any form or by any means, electronic or mechanical, for any purpose, in whole or in part, without the express written permission of SHARP.
* In case of using the device for applications such as control and safety equipment for transportation (aircraft, trains, automobiles, etc.), rescue and security equipment and various safety related equipment which require higher reliability and safety, take into consideration that appropriate measures such as fail-safe functions and redundant system design should be taken.
* Do not use the device for equipment that requires an extreme level of reliability, such as aerospace applications, telecommunication equipment (trunk lines), nuclear power control equipment and medical or other equipment for life support.
* SHARP assumes no responsibility for any damage resulting from the use of the device that does not comply with the instructions and the precautions specified in these specification.
* Contact and consult with a SHARP sales representative for any questions about this device.

2 Overview

This Open Cell (LK400D3HA14)is a color active matrix LCD incorporating amorphous silicon TFT (Thin Film Transistor). It is composed of a color TFT-LCD panel, driver ICs and Source PWB. Graphics and texts can be displayed on a 1920×RGB×1080 dots panel by using LVDS(Low Voltage Differential Signaling) for the interface of a special timing control substrate.

The content of this specifications can be filled by using C-PWB (LK0DZ1C0089(RUNTK4224TPZD)) and FPC (LK0DZ1C0112) of the Sharp specification. This C-PWB applies the Over Shoot driving (O/S driving) technology in order to improve the response time of LCD.In the O/S driving technology, signals are being applied to the Liquid Crystal according to a pre-fixed process as an image signal of the present frame when a difference is found between image signal of the previous frame and that of the current frame after comparing them.

With combination of these technologies, motion blur can be reduced and clearer display performance can be realized.

[Note]About the relation between data input and back light lighting, please base on the above-mentioned input sequence. When back light is switched on before panel operation or after a panel operation stop, it may not display normally. But this phenomenon is not based on change of an incoming signal, and does not give damage to a liquid crystal display.

[Note 2] Typical current situation: 1023 gray-bar patterns. (Vcc = +12.0V)
The explanation of RGB gray scale is seen in section 8.

[Note2]-When vertical period is very long, flicker and etc. may occur.

-Please turn off the module after it shows the black screen.

-Please make sure that length of vertical period should become of an integral multiple of horizontal length of period. Otherwise, the screen may not display properly.

-As for your final setting of driving timing, we will conduct operation check test at our side, please inform your final setting.

*Optical characteristics are based on SHARP module LK400D3LA14

-The measurement shall be executed 60 minutes after lighting at rating.

[Note]The optical characteristics are measured using the following equipment.

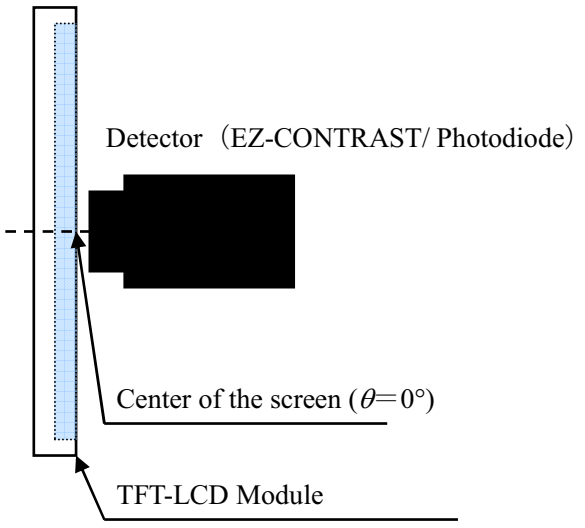

Fig.4-1 Measurement of viewing angle range and Response time.
Viewing angle range: EZ-CONTRAST
Response time: Photodiode

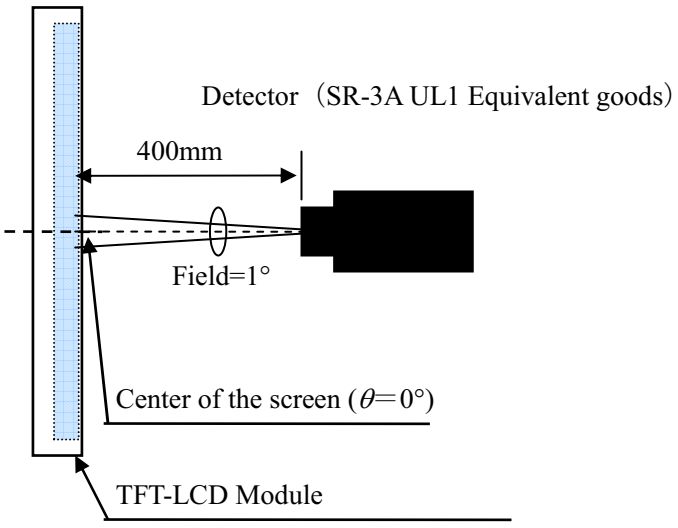

Fig.4-2 Measurement of Contrast, Luminance, Chromaticity.

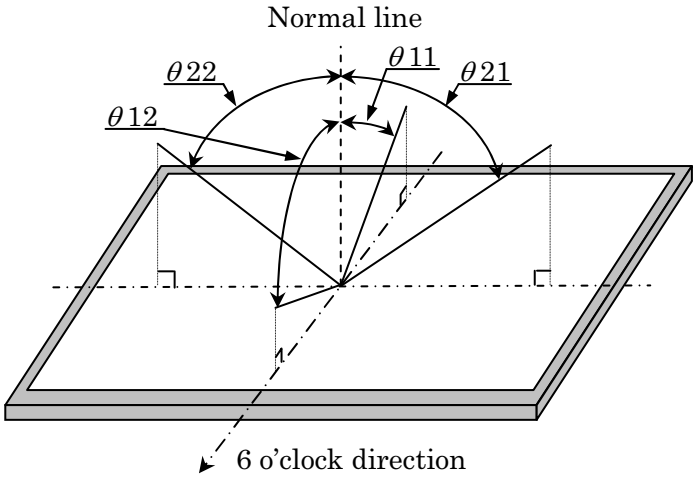
[Note 1]Definitions of viewing angle range :



[Note 2]Definition of contrast ratio :

The contrast ratio is defined as the following.

$$\text{Contrast Ratio} = \frac{\text{Luminance (brightness) with all pixels white}}{\text{Luminance (brightness) with all pixels black}}$$

[Note 3]Definition of response time ▲C

The response time (τ) is defined as the following figure and shall be measured by switching the input signal for "any level of gray (0%, 25%, 50%, 75% and 100%)" and "any level of gray (0%, 25%, 50%, 75% and 100%)".

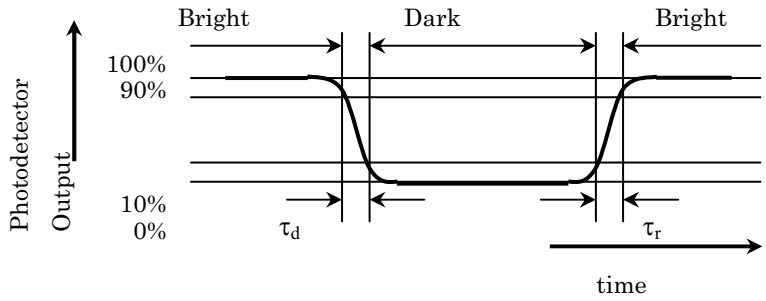
100%	td: 100%-0%	td: 100%-25%	td: 100%-50%	td:100%-75%	

t*:x-y...response time from level of gray(x) to level of gray(y)

$\tau = \Sigma(t^*:x\text{-}y)/20$



[Note 4]This shall be measured at center of the screen.

[Note 5] This value is valid when O/S driving is used at typical input time value.

[Note 6]

White uniformity is defined as the following with five measurements. (A~E)

$$\delta W = \frac{\text{Maximum luminance of five points (brightness)}}{\text{Minimum luminance of five points (brightness)}}$$

: 1390 (W)×1150 (D)×984 (H) (type B)

d) Total mass of one carton filled with full cell : 358.4 kg(Max) (type A and type B)
: 409.5 kg(Max) (type C)

7.2 Label (▲A, ▲B, ▲C)

a) Cell Label

This label is stuck on the protection film of front polarizer.
(Please trace the Cell lot number after the film is peeled off.)

8 Carton storage condition.

Temperature	0°C to 40°C
Humidity	95%RH or less
Reference condition	: 20°C to 35°C, 85%RH or less. (summer) : 5°C to 15°C, 85%RH or less. (winter) · the total storage time (40°C, 95%RH) : 240H or less
Sunlight	Be sure to shelter a product from the direct sunlight.
Atmosphere	Harmful gas, such as acid and alkali which bites electronic components and/or wires must not be detected.
Notes	Be sure to put cartons on palette or base, don't put it on floor, and store them with removing from wall Please take care of ventilation in storehouse and around cartons, and control changing temperature is within limits of natural environment
Storage life	1 year

9 Reliability

Reliability test item

Open Cell

No.	Test item	Condition
1	High temperature storage test	Ta=60°C 240h
2	Low temperature storage test	Ta=-25°C 240h
3	High temperature and high humidity operation test	Ta=40°C ; 95%RH 240h (No condensation)
4	High temperature operation test	Ta=50°C 240h
5	Low temperature operation test	Ta=0°C 240h

Above tests are executed under the CCFL module conditions

10 Handling Precautions of the Open Cell ▲C

a) Be sure to turn off the power supply when inserting or disconnecting the cable.

b) Be sure to design the module and cabinet so that the open cell can be installed without any extra stress such as warp or twist.

c) Since the polarizer is easily damaged, pay attention not to scratch it.

d) Since long contact with water may cause discoloration or spots, wipe off water drop immediately.

e) When the panel surface is soiled, wipe it with absorbent cotton or other soft cloth.

f) Since the panel is made of glass, it may break or crack if dropped or bumped on hard surface. Handle with care.

g) Since a open cell consists of a TFT cell and electronic circuits with CMOS-ICs, which are very weak to electrostatic discharge, persons who are handling a open cell should be grounded through adequate methods such as an anti-static wrist band. Connector pins should not be touched directly with bare hands.

·Reference : Process control standard of sharp

	item	Management standard value and performance standard
1	Anti-static mat(shelf)	1 to 50 [Mega ohm]
2	Anti-static mat(floor,desk)	1 to 100 [Mega ohm]
3	Ionizer	Attenuate from ±1000V to ±100V within two seconds.
4	Anti-static wrist band	0.8 to 10 [Mega ohm]
5	Anti-static wrist band entry and ground resistance	Below 1000 [ohm]
6	Temperature	22 to 26 [℃]
7	Humidity	60 to 70 [%]

h) The open cell has some PWBs, take care to keep them form any stress or pressure when handling or installing the open cell; otherwise some of electronic parts on the PWBs may be damaged.

i) When handling open cell modules and assembling them into cabinets, please be noted that long-term storage in the environment of oxidization or deoxidization gas and the use of such materials as reagent, solvent, adhesive, resin, etc. which generate these gasses, may cause corrosion and discoloration of the open cells.

j) Observe all other precautionary requirements in handling components.

k) Applying too much force and stress to PWB and driver (COF) may cause a malfunction electrically and mechanically.

l) The open cell has high frequency circuits. Sufficient suppression to EMI should be done by system manufacturers.

m) When you peel the protection film for a polarizer.

・The protection film should be peeled as Fig.3

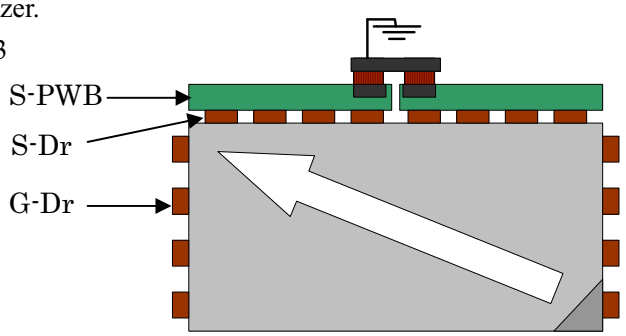

Fig.3 Direction peeled off

・Slowly((Recommendation : more than 5[sec]) & constant speed

・Persons who are electrically grounded with adequate methods such as an anti-static wrist band.

・Ionized air should be blown over the during peeling action.

・Ground S-PWB connectors while peeling of a protection film.

・The protection film must not touch DRIVER and S-PWB.

・Please remove with isopropyl-alcohol if adhesive may remain on a polarizer after a protection film is peeled off.

n) Electrical components which may not affect electrical performance are subjective to change without notice because of their availability.

11 Others

1) Please be careful since image retention may occur when a fixed pattern is displayed for a long time.

2) The chemical compound, which causes the destruction of ozone layer, is not being used.

3) This Open Cell module is corresponded to RoHS.

4) When any question or issue occurs, it shall be solved by mutual discussion.
